SUMMARY

Backend engineer with internship experience delivering production APIs in Node.js/Express and Golang. Comfortable with PostgreSQL, MongoDB, Docker, and event-driven microservices using gRPC and RabbitMQ.

EXPERIENCE

Backend Engineer Intern

PT. Paragon Technology and Innovation

November 2025 - May 2026, Jakarta, Indonesia

- Developed and implemented a Product Information Management (PIM) system using Express.js as the backend framework and Sequelize as the Object Relational Mapper (ORM), supporting Paragon's omnichannel product data operations.
- Improved maintainability by replacing scattered hardcoded values with enums and introducing reusable, modular patterns across the codebase.
- Built cron jobs, migrations, authentication, and reporting for a PIM system managing the multi-department product-approval pipeline for Paragon's online marketplaces, where $\geq 80\%$ of product submissions passed approval within 3 days and rework stayed below 20%.

Application Developer Intern

PT. Astra Graphia Information Technology

February 2024 - February 2025, Jakarta, Indonesia

- Built custom features for a Microsoft Dynamics 365 Finance & Operations (D365 F&O) ERP system in X++, including custom forms and SSRS reports, using the Chain of Command extension pattern for non-intrusive modifications.
- Wrote SQL queries to support the PowerApps team during integration testing.
- Delivered several ERP features end-to-end in X++, including custom forms, business-rule validation logic, and a scheduled batch job for automated record flagging, while writing SQL queries and translating stakeholder requirements into tested, working code.

PROJECT

Twitter Backend Clone

Personal Project • October 2025 - May 2026

- Built a microservices backend in Golang with 4 services communicating over gRPC, using Consul for service discovery and health checks.
- Designed an event-driven architecture using RabbitMQ, where services publish domain events (tweet.created, tweet.liked, user.followed) that a notification service consumes asynchronously, writes to MongoDB, and uses to trigger email notifications.
- Added distributed tracing with OpenTelemetry/Jaeger and a middleware decorator pattern for structured logging across gRPC handlers.
- Set up a full local stack in Docker Compose including PostgreSQL, MongoDB, Redis, RabbitMQ, Consul, and Jaeger.

Auction Web App

Personal Project • July 2024 - September 2024

- Built a real-time auction platform in Golang supporting concurrent live auctions with instant bid broadcasting over WebSockets.
- Implemented a per-auction WebSocket hub where each live auction ran its own goroutine event loop (selecting over register, unregister, and broadcast channels), and replayed the full bid history to clients joining mid-auction.
- Each connected client ran two goroutines, a write pump that drained a buffered send channel with ping/pong keepalive and a read pump that wrote the bid to PostgreSQL before pushing it to the hub for broadcast.

EDUCATION

Computer Science

Bina Nusantara University • Bandung, Indonesia • 2025 • 3.71/4.00

- Area of Interest : Back-end/Full-Stack Development, Web Development

SKILLS

Languages: Bahasa Indonesia (Native), English (Professional working proficiency)

Hard Skills: Golang, JavaScript, TypeScript, Express.js, Java, PostgreSQL, MySQL, MongoDB, Redis, RabbitMQ, Consul, Jaeger, Docker, Nginx, AWS, Git, HTML5, Tailwind, X++ (D365 F&O).

Soft Skills: Problem Solving, Analytical Thinking, Communication, Collaboration, Adaptability
