SUMMARY

Backend engineer with hands-on internship experience as a Backend Engineer at PT Paragon Technology and Innovation and an Application Developer at PT Astra Graphia Information Technology. Proficient in Golang, Java, SQL, and Express.js, with a strong foundation in building scalable, event-driven systems.

EXPERIENCE

Backend Engineer Intern

PT. Paragon Technology and Innovation

November 2025 - May 2026, Jakarta, Indonesia

- Developed and implemented a Product Information Management (PIM) system using Express.js as the backend framework and Sequelize as the Object Relational Mapper (ORM), supporting Paragon's omnichannel product data operations.
- Enhanced application maintainability and code quality by refactoring hardcoded values into enumerations (enums) and implementing reusable, modular code patterns to improve long-term scalability.
- Delivered features spanning CRON jobs, database migrations, authentication, and report generation, contributing to a system that achieved an ≥80% brief approval rate within 3 days and kept rework below 20%.

Application Developer Intern

PT. Astra Graphia Information Technology

February 2024 - February 2025, Jakarta, Indonesia

- Developed and implemented advanced features for the Enterprise Resource Planning (ERP) system (Ax365 FO) using X++ and Object-Oriented Programming (OOP), covering custom forms, SSRS reports, and modification using Chain of Command methodology (extension).
- Wrote complex multi-table SQL queries to support integration testing for the PowerApps team.
- Managed and delivered multiple CRs, including the CR Flagging Service Contract (implementing validation and Work Request-to-Work Order conversion) and CR Validasi Expire (implementing sorting, visual highlighting, and developing a batch job/CRON Job for optimized data flagging).

PROJECT

Twitter Backend Clone

Personal Project • October 2025 - May 2026

- Built a microservices backend in Golang creating 4 services talking over gRPC with Consul handling service discovery and health checks.
- Designed an event-driven architecture using RabbitMQ, where services publish domain events (tweet.created, tweet.liked, user.followed) that a notification service consumes asynchronously, writes to MongoDB, and uses to trigger email notifications.
- Added distributed tracing with OpenTelemetry/Jaeger and a middleware decorator pattern for structured logging across gRPC handlers.
- Set up a full local stack in Docker Compose including PostgreSQL, MongoDB, Redis, RabbitMQ, Consul, and Jaeger.

Auction Web Apps

Personal Project • July 2024 - September 2024

- Built a per-auction WebSocket hub in Go, where each live auction runs its own goroutine event loop (select over register/unregister/broadcast channels) that replays full bid history to clients joining mid-auction.
- Each connected client runs two goroutines, a write pump that drains a buffered send channel with ping/pong keepalive and a read pump that writes the bid to PostgreSQL before pushing it to the hub for broadcast.

EDUCATION

Computer Science

Bina Nusantara University • Bandung, Indonesia • January 2025 • 3.71/4.00

- Area of Interest : Back-end/Full-Stack Development, Web-Development

SKILLS

Language: Bahasa (Native), English

Hard Skills: JavaScript, Express JS, Java, PostgreSQL, MongoDB, MySQL, Golang, ASP.NET (C#), TypeScript, Git, HTML5, Tailwind, Nginx, Docker, AWS, Redis, RabbitMQ, Consul, Jaeger, X++ (Ax365FO).

Soft Skills: Collaboration, Teamwork, Critical Thinking, Problem Solving, Attention to Detail, Analytical Thinking, Eagerness to Learn
